

Official Firm Data for Germany

The AFiD-products of the RDC: Opportunities and constraints

Kristin Nowak, regional RDC-Office Stuttgart
Diane Zabel, regional RDC-Office Bremen
Vienna, September 6th 2017

Table of contents

1. Introduction

1.1. What are research data centres (RDCs)?

1.2. Microdata:

1.2.1. Advantages and drawbacks

1.2.2. Microdata in „our“ RDCs

2. The AFiD-Project: „**A**mtliche **F**irmendaten für **D**eutschland“

(AFiD= „**O**fficial firm data for **G**ermany“)

2.1. Background, the approach and current products

2.2. AFiD-panels and „AFiD-modules“: Content and research potential

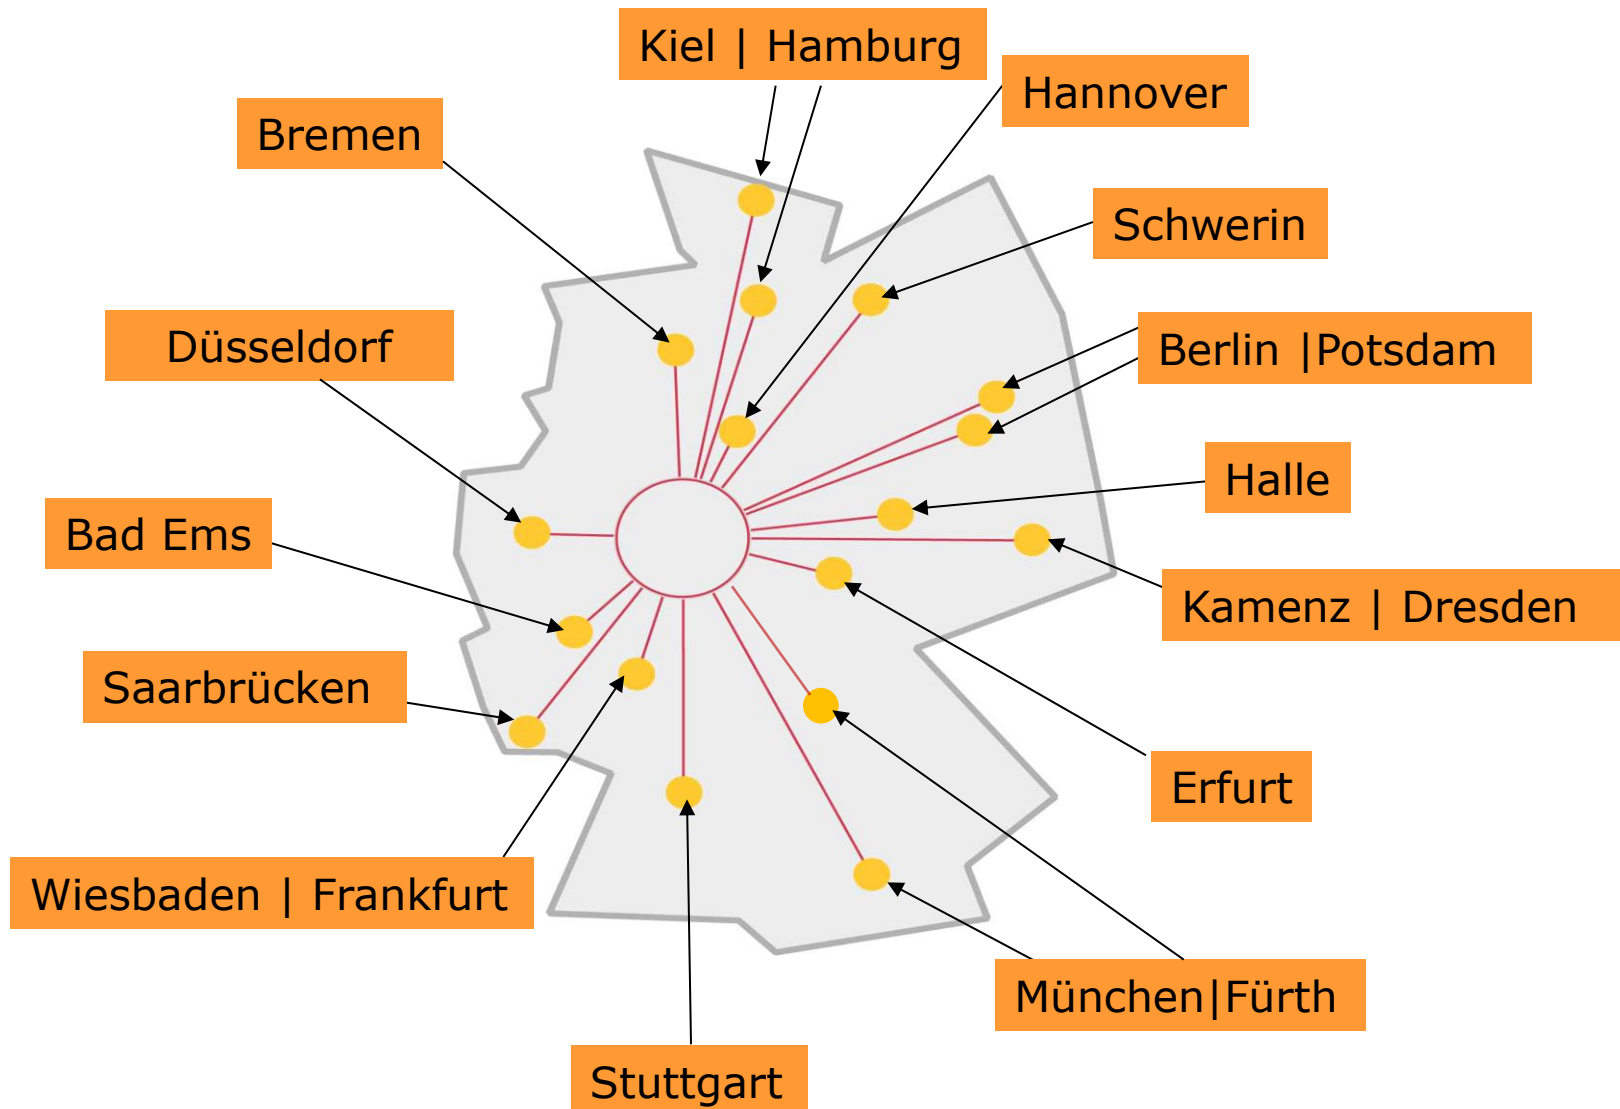

2.3. Opportunities and constraints of the AFiD-Project

1. Introduction

1.1. What are research data centres (RDCs)?

- Centres for official **microdata**
- Part of the „**informational infrastructure**“ for scientists in Germany
- **Service institutions that mediate** between opposing interests
- Main tasks:
 - Generate supply of microdata:
Centralised **preparation** (anonymization, supply of metadata etc.), centralised **management** and **supply** of microdata via various forms of access
 - Accompany the demand for microdata:
RDCs enable scientific **analysis** of microdata in compliance with confidentiality rules; they advise the scientists on how to use the data

The RDC of the German regional statistical offices: a working group with locations in every region

1.2.1. Microdata: advantages and drawbacks

- Higher informational content than aggregate data
- Better and more diverse options for **in-depth analysis**. Therefore answers to data questions are **more valid**, i.e. better in touch with reality and more to the point.
- Example: interrelationships between variables can be better examined, e.g. through regression analysis
- Microdata are especially well suited to (see Joachim Wagner (2015)):
 - a) discover new **stylised facts**,
 - b) test **model assumptions**,
 - c) test **hypotheses** and
 - d) to evaluate (economic) **policy** measures.
- But: Microdata are subject to **confidentiality legislation** for statistical data production, as they contain information for individuals or individual firms
- **Legislators** allow the use of official microdata under certain conditions (§ 16 BStatG)

1.2.2. Microdata in „our“ RDCs

- **RDCs contain more than 100 statistics in the areas of:**
 - Economy (manufacturing, services, etc.)
 - Social themes (households, population, health, education)
 - Agriculture, energy and environment
 - Finance and taxation
 - Law and others
- => statistics most in demand by scientists enter the RDCs
- About 40% of the demand for statistics in our RDC in 2016 was about **AFiD-products**, compared to about 20% for the German „Mikrozensus“
- **Meta data** mostly on the internet: www.forschungsdatenzentrum.de
- A **fee** is levied from users (for most forms of data access)

**2. The AFiD-Project: „Amtliche Firmendaten für Deutschland“
(AFiD= „Official firm data for Germany“)**

2.1. Background, the approach and current products

AFiD: Background

- **Problems of isolated official statistics that AFiD tries to solve:**
 - a) Limited number of variables (due to legal requirements)
 - b) Access to well prepared microdata time-series

- **Requirements to solve these problems through data integration:**
 - a) **technical:**
 - availability of common numeric identifiers for firms in the respective statistic and year

 - b) **legal:**
 - legitimacy of **data integrations** for firms (but not individuals): §13a BStatG;
 - legitimacy to **store** common numeric identifiers for 30 years

The AFiD-approach

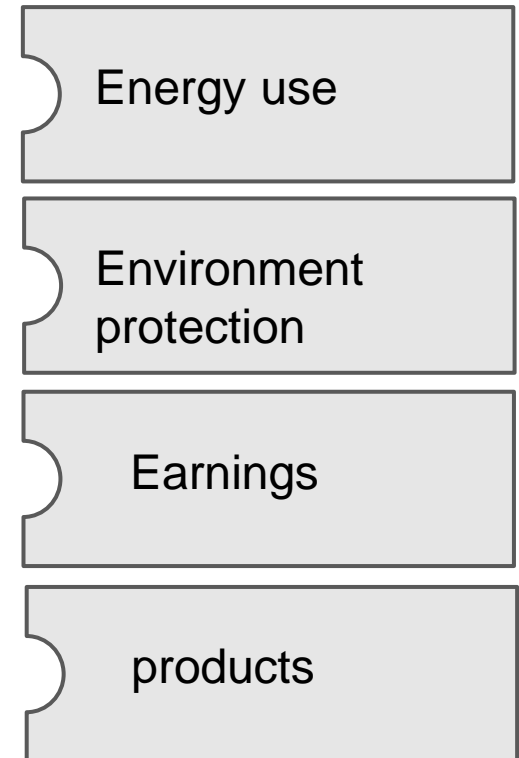

- **Two step data integration** of firm-related microdata available in our RDC:
 1. Time-series or cross-sectional integration of official statistics:
 - Result: **Standardised AFiD-products** (panels und modules)
 - Example: AFiD-panel (local) Industrial Units
 - = cross-section fusion of four official sample surveys in manufacturing
 2. Prompt and flexible add-on data matching tailored to the specific **needs of each research project**: e. g. matching of various standardised AFiD-products, like AFiD-modules and AFiD-panels.
- **Currently available outcome:**
 - eight AFiD-panels,
 - six AFiD-modules,
 - many project-specific microdata sets and
 - comprehensive meta data
- A wealth of integrated microdata for empirical research on firms in Germany

Currently available AFiD-products

AFiD-panels

AFiD-modules

2.2. Selected AFiD-panels: Content and research potential

AFiD-panels Industrial Units and Industrial Enterprises

- **Availability:** Industrial Units: 1995 – 2014, Industrial Enterprises: 2001 – 2014
- **Panel Industrial Units: Variables:**
 - number of employees
 - turnover
 - investments
 - wages and salaries
 - branch, official regional identifier (AGS → e.g. LAU-2-level), and other variables
- **Panel Industrial Enterprises:**
 - Additionally: information on **cost** structures including taxes and subsidies
- **Research potential:**
 - Differentiated analysis of enterprise success over branches, regions and time
 - Example of publication: Differences of technical efficiency across industrial branches

AFiD-panel official Statistical Business Register (URS-panel)

- Currently available for the years: 2000 – 2012.
- Variables:
 - number of employees subject to social insurance contribution (**SVB**)
 - branch (**WZ**), official regional identifier (**AGS**), **legal form** of enterprise
 - local units pertaining to an enterprise; enterprise **groups** (organizational and tax-wise)
 - various numeric **identifiers** for data matching (e. g.. URS-IDs, tax identifier, membership numbers (e. g. IHK), identifier for local units of the federal employment agency, identifier of the German commercial register, etc.)
 - **turnover** of enterprises – not available for general analysis – might, however, be used as control variables in complex investigations, e.g. regression
- Potential:
 - „**complete data collection**“ → enables differentiated analysis across e. g. branches and regions
 - important for all **data matching** projects (URS is the ‚heart‘ of the AFID-project)
 - **concentration processes** can be analysed
 - However: limited themes for analysis due to lack of thematic, numerical variables (only **SVB**)

AFiD-panel Services

- Currently available years: 2003 - 2007 and 2008 - 2010, sample
- **Variables** for enterprises:
 - **staff** (number, costs)
 - revenue
 - **turnover** according to type of service (branches)
 - **input**
 - **taxes, subsidies**
 - **general** and other variables.
- **Potential:**
 - Analysis of enterprises in service

2.2. Selected AFiD-modules: Content and research potential

AFiD-module Earnings

- Linked. employer-employee-data, sample.
- Currently available years: 2001, 2006, 2010, 2014.
- **Variables** (for local units in manufacturing & services):

Employer-data set for local units:

- **employees** (type, gender)
- code of **collective labour agreement**
- weekly **working hours**, holidays
- general data (official regional identifier, branch)
- and other variables

Employee-data set:

- **pay scale classification** etc.
- **income**, income-tax group, tax exemption for dependent children, taxes, social-insurance contributions, etc.
- **occupation**, training
- **working hours**
- general data (branch, gender, year + month of birth, seniority) ...

→ Potential: e. g. analysis of qualification, age and income structure

AFiD-module Environmental Investment

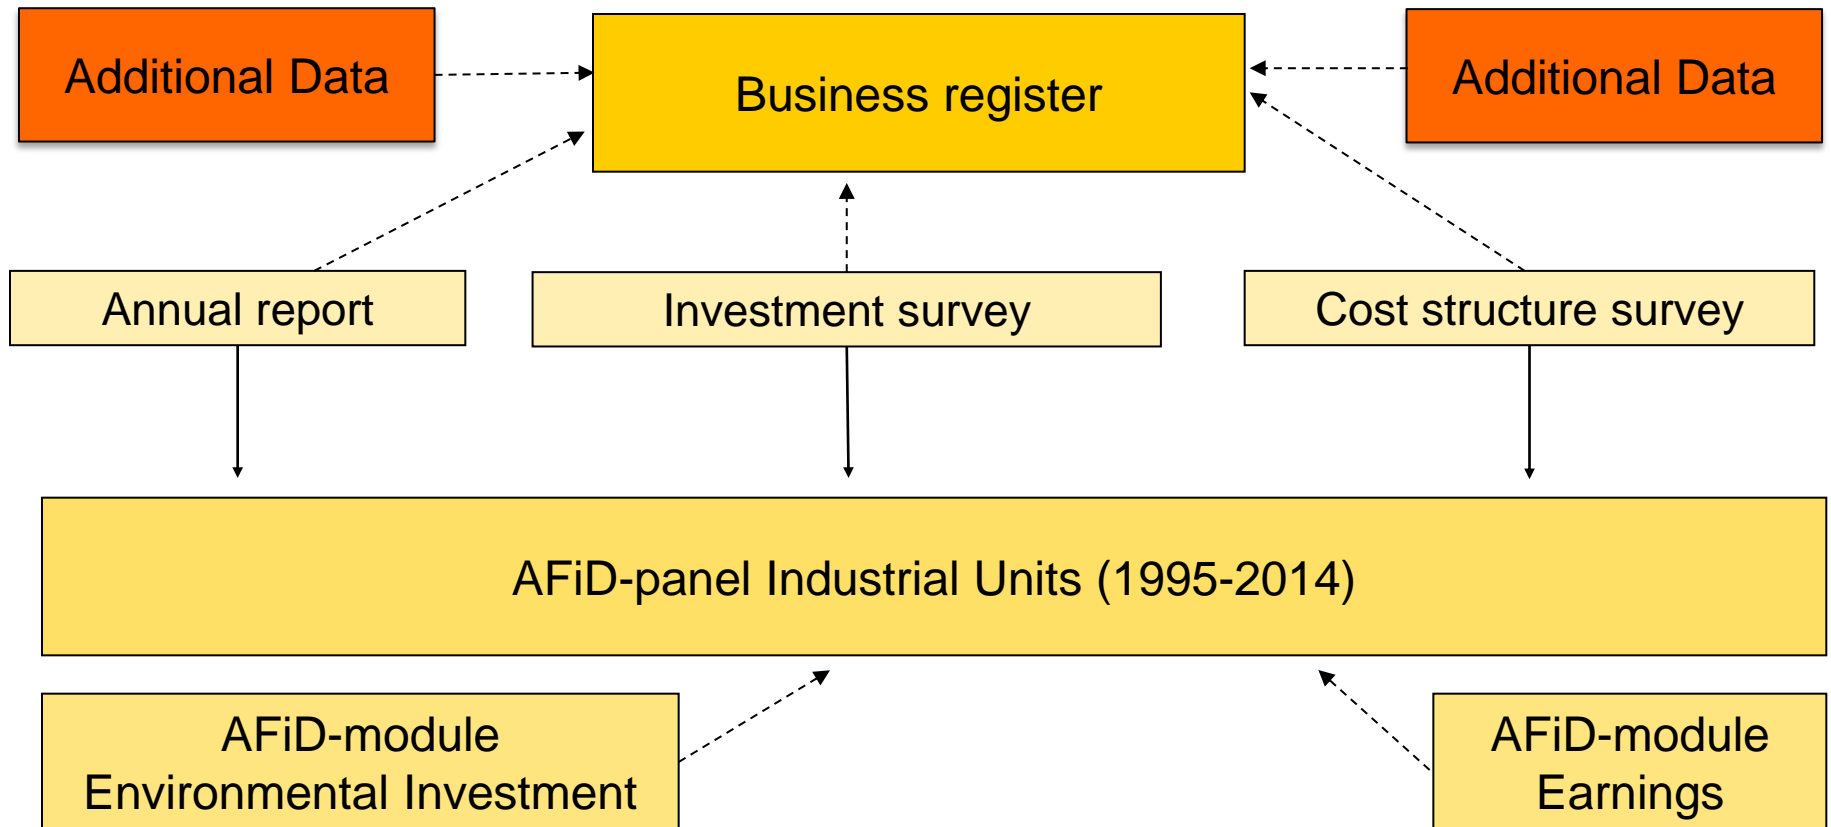

- Currently available years: 2003 - 2005 and 2006 - 2014, Sample
- Variables:
 - **Investments to protect the environment** (including rent for plant and equipment), split on subjects as:
 - Waste
 - Water
 - Air
 - Noise
 - Climate
 - Nature
- Potential:
 - Analysis of demand side of environmental goods + x
 - Exemplary publication: The effects of electricity taxation in manufacturing

2.3. Opportunities and constraints of the AFiD-project

Opportunities for matching additional data on AFiD-products

1. **Match microdata of various AFiD-products** (via URS-identifiers)
E.g.: AFiD-module Energy Use → AFiD-panel Industrial Enterprises
2. **Match microdata of additional official statistics of the German statistical offices**, e. g. special topics surveys, process-related data (like the ‚sales tax statistic‘ and ‚foreign trade statistic‘)
3. **Match ‚generally available‘ microdata from non-official sources**, e. g. credit-worthiness data on Enterprises by Creditreform
4. **Match microdata of additional official data producers**, like the ‚German Central Bank‘ and the ‚German labour agency‘ („KomBiFiD pilot project“; enhanced options due to current amendment of the basic German Statistical Law (BStatG))
5. **Join external aggregated (grouped) data on the AFiD data via grouping variables** like official regions (AGS), branch-identifiers (WZ) and legal form

Outline on AFiD-projects

Constraints of the AFiD-project

Limitations of the data:

- **Discontinuities in certain variables** over time (e.g. official regions, branches)
→ may produce problems in data processing and analysis
- **Complete counts are often not available**
→ limits to e.g. the regional or branch-related differentiation of analyses
- Discontinuities in **sample selection**
→ participation numbers for balanced Panels for longer time-series may be reduced
- The **number of available variables** is largely fixed by law
→ not all questions may be answered with the data

Organisational, legal and personal constraints:

- **Preparatory times** for complex AFiD-projects may be long.
→ current efforts go in the direction of delegating final work of data preparation to scientists
- **RDC fees** may be rather high – especially for complex projects with many datasets and fusions
- Current draft of the amendment of the **German official statistical law (BStatG)**: limited storage time (10 years) for the URS-identifiers might impinge on the AFiD-project
- Data users need **programming know-how** in either STATA, SAS, SPSS (or R)

Thank you for your attention!
